

Customer Problem Statement

A well-articulated problem statement helps focus the design and development of BookNest on what actually matters to each type of user. Below, I have written a problem statement for each of the three user roles in BookNest: customer, seller, and administrator, following the "I am / I'm trying to / but / because / which makes me feel" format.

Problem Statements by User Role

PS	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1	a customer who wants to buy books online	browse and purchase books quickly and reliably	I often can't tell if a book is in stock or the listing is outdated	there is no centralized system keeping book inventory updated in real time	frustrated and unsure whether my order will actually go through
PS-2	a bookseller listing my books on the platform	manage my book listings, stock, and incoming orders easily	manual tracking makes it slow to update listings and easy to miss orders	there is no dedicated dashboard for sellers to manage inventory and orders in one place	overwhelmed and worried about losing sales due to outdated listings
PS-3	an administrator overseeing the platform	monitor and manage users, sellers, books, and orders from one place	user and seller activity is scattered with no single view of the platform	there is no secure admin dashboard to control access and oversee platform activity	concerned about losing control over data accuracy and platform security

These three problem statements collectively define the scope of BookNest: a platform that must serve the browsing and purchasing needs of customers, the listing and order management needs of sellers, and the oversight and control needs of administrators, all within one secure system.
