

Step 5: Proposed Solution Template

BookNest — Online Bookstore Management Platform

Prepared By	Manisha Baddireddy
Project Type	Individual Project (Solo Development)

The following table describes the proposed solution for BookNest across the parameters required for project submission.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Existing bookstores often lack an efficient digital platform to manage books, sellers, customers, and orders in one place. Manual processes make inventory management, user administration, and book updates time-consuming and error-prone.
2.	Idea / Solution Description	BookNest is a centralized online bookstore platform where customers can browse and purchase books, sellers can list and manage their books and orders, and administrators can oversee users, sellers, books, and platform activity through a secure, role-based dashboard.
3.	Novelty / Uniqueness	Unlike a typical single-sided bookstore site, BookNest brings customers, sellers, and administrators together in one secure system with role-based access, so buying, selling, and platform oversight all happen through a single connected application rather than separate manual processes.
4.	Social Impact / Customer Satisfaction	Customers get a faster, more reliable way to find and buy books with accurate stock and order information. Sellers, including small or independent booksellers, get an accessible digital storefront without needing separate technical infrastructure, improving their reach and reducing manual errors.
5.	Business Model (Revenue Model)	Revenue can be generated through a commission on each book sale made via the platform, optional listing or subscription fees for sellers who want extended catalog visibility, and featured/promoted book placements on the customer-facing storefront.
6.	Scalability of the Solution	Built on a modular MERN-based architecture (MongoDB, Express, React, Node) with role-based access control, BookNest can scale to support more sellers, customers, and book categories, and can be extended with additional features such as recommendations, payments, and analytics as usage grows.
